Instalasi Flutter

Source <https://docs.flutter.dev/install/with-vs-code>

Download prerequisite software

For the smoothest Flutter setup, first install the following tools.

1. Install Git for Windows

Download and install the latest version of Git for Windows.

For help installing or troubleshooting Git, reference the Git documentation.

2. Download and install Visual Studio Code

To quickly install Flutter, then edit and debug your apps, install and set up Visual Studio Code.

Install and set up Flutter

Now that you've installed Git and VS Code, follow these steps to use VS Code to install and set up Flutter.

1. Launch VS Code

If not already open, open VS Code by searching for it with Spotlight or opening it manually from the directory where it's installed.

2. Add the Flutter extension to VS Code

To add the Dart and Flutter extensions to VS Code, visit the Flutter extension's marketplace page, and click Install. If prompted by your browser, allow it to open VS Code.

3. Install Flutter with VS Code

Open the command palette in VS Code.

4. Go to View > Command Palette or press Command + Shift + P.

In the command palette, type flutter. Select Flutter: New

Project.

5. VS Code prompts you to locate the Flutter SDK on your computer. Select Download SDK.
6. When the Select Folder for Flutter SDK dialog displays, choose where you want to install Flutter.
7. Click Clone Flutter.

While downloading Flutter, VS Code displays this pop-up

notification: Downloading the Flutter SDK. This may take a few minutes.

8. Click Add SDK to PATH.

When successful, a notification displays:

The Flutter SDK was added to your PATH

9. VS Code might display a Google Analytics notice.

If you agree, click OK.

10. To ensure that Flutter is available in all terminals:

- a. Close, then reopen all terminal windows.
- b. Restart VS Code.

11. Validate your setup

To ensure you installed Flutter correctly, run `flutter doctor -v` in your preferred terminal
